

Project Topic Summary

Project Title: Property & Household Management System

What is it about?

The **Property & Household Management System (PHMS)** is a web-based application designed to simplify the management of residential properties and households. It provides a centralized platform where property owners, managers, tenants, and maintenance staff can efficiently manage property information, tenant records, rent payments, utility bills, maintenance requests, household inventory, and financial reports. The system replaces traditional paper-based or manual processes with a secure and user-friendly digital solution that can be accessed anytime through a web browser.

Why is it important to solve?

Managing residential properties manually often leads to problems such as misplaced records, delayed rent collection, poor communication, inefficient maintenance tracking, and difficulty monitoring expenses. These issues reduce productivity and increase operational costs. A web-based management system helps automate routine tasks, improves transparency, minimizes human errors and enables faster decision-making through real-time data and reporting.

How to solve the problem?

The proposed solution is to develop a responsive web application using technologies such as HTML, CSS, Bootstrap, JavaScript, PHP (or Laravel), and MySQL. The system will include secure user authentication with different roles (Admin, Property Owner, Tenant, and Maintenance Staff). Core features will include property management, tenant management, rent collection, utility bill tracking, maintenance request management, household inventory, notice board and report generation. The application will provide a centralized database that ensures secure storage and easy retrieval of information.

Who are the stakeholders?

The primary stakeholders of the project are:

- Property Owners
- Property Managers
- Tenants

- Maintenance Staff
- Building Caretakers
- Accountants/Finance Personnel
- System Administrator

Where is the best place to provide the solution?

The system is suitable for apartment buildings, residential complexes, rental houses, hostels, gated communities, and real estate management companies. Since it is a web application, users can securely access the system from anywhere using a computer, tablet or smartphone with an internet connection.

When to solve (Gantt Chart)

Task	Week 1	Week 2	Week 3	Week 4	Week 5	Week 6	Week 7	Week 8
Requirement Analysis	✓							
Database Design	✓	✓						
UI/UX Design		✓	✓					
Backend Development			✓	✓	✓			
Frontend Development				✓	✓	✓		
Testing & Bug Fixing						✓	✓	
Documentation							✓	✓
Final Deployment & Presentation								✓

Explanation: The project begins with requirement analysis and database design followed by interface design. Backend and frontend development are completed in parallel to improve efficiency. After implementation, testing and debugging ensure system reliability. Finally, documentation, deployment and project presentation are completed during the last week.
